Expno: 5 Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application – Hospital Appointment Booking Form — Reporting & Dashboard Use Case

1. Aim:

To build report views on top of the Appointment_Booking_Form — a tabular report listing every booking and a Kanban report (appointment_report) grouped by Department — and to design a custom Dashboard page (Hospital_Appointment_Dashboard) using Zoho Creator's UI Builder (Page Builder) that gives the front desk and doctors an at-a-glance view of appointment volume, patient age distribution and department-wise load.

This addresses the hospital's need to move from a flat list of bookings to visual, role-friendly views that make it easy to see how patients are spread across departments and to track booking trends without opening every record individually.

2. Procedure:

Step 1: Design the form — The Appointment_Booking_Form was created in Zoho Creator with the sections Patient Details (Patient name, Age, Gender), Contact Details (Email Address, Contact Number, Residential Address), Medical_Details (Referred By, Department, Existing Conditions, Symptoms Description) and Scheduling Consent (Preferred Appointment Date, Preferred Appointment Time, Consent For Treatment).

Step 2: Enter sample data — Ten patient records were submitted through the form, one for each department (Cardiology, Dental, Dermatology, ENT, General Medicine, Gynecology, Neurology, Ophthalmology, Orthopedics and Pediatrics).

Step 3: Create the list report — A report named Appointment_Booking_Form Report was created on the form as a List report, with the columns Patient name, Residential Address, Age, Gender, Email Address, Contact Number and Referred By.

Step 4: Create the Kanban report — A second report, appointment_report, was added on the same form and its type was set to Kanban.

Step 5: Configure Kanban properties — In the Report Builder, *Group Columns By* was set to Department so that each column represents one department. The card fields were set to show the patient name, department, email address, contact number and age, and the record count is displayed beside each column heading.

Step 6: Open the Page Builder — A new custom page named Hospital_Appointment_Dashboard was created for the application using Zoho Creator's Page Builder (UI Builder), which provides elements such as Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button and Widgets.

Step 7: Add a title panel with a button — A Panel element was placed at the top of the page with the heading “Appointment_Booking_Form Report” and a *View* button linked to the Appointment_Booking_Form Report.

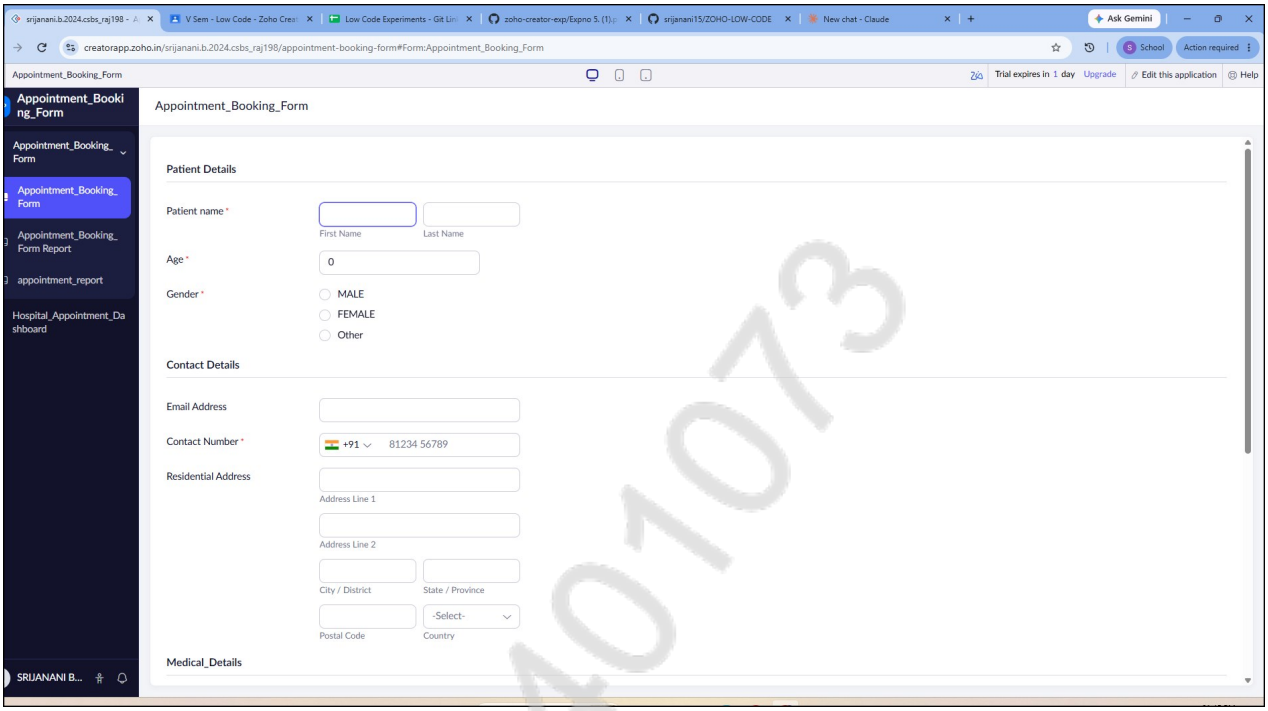

Step 8: Add the chart — A Bar chart was added below the panel, with Department on the X-axis and Age on the Y-axis, sourced from the Appointment_Booking_Form.

Step 9: Embed the Kanban report — The appointment_report element was added beneath the chart so that the dashboard also lists the department-wise patient cards in one place.

Step 10: Publish and verify — The application was run in access mode and the form, both reports and the dashboard were checked with the sample data.

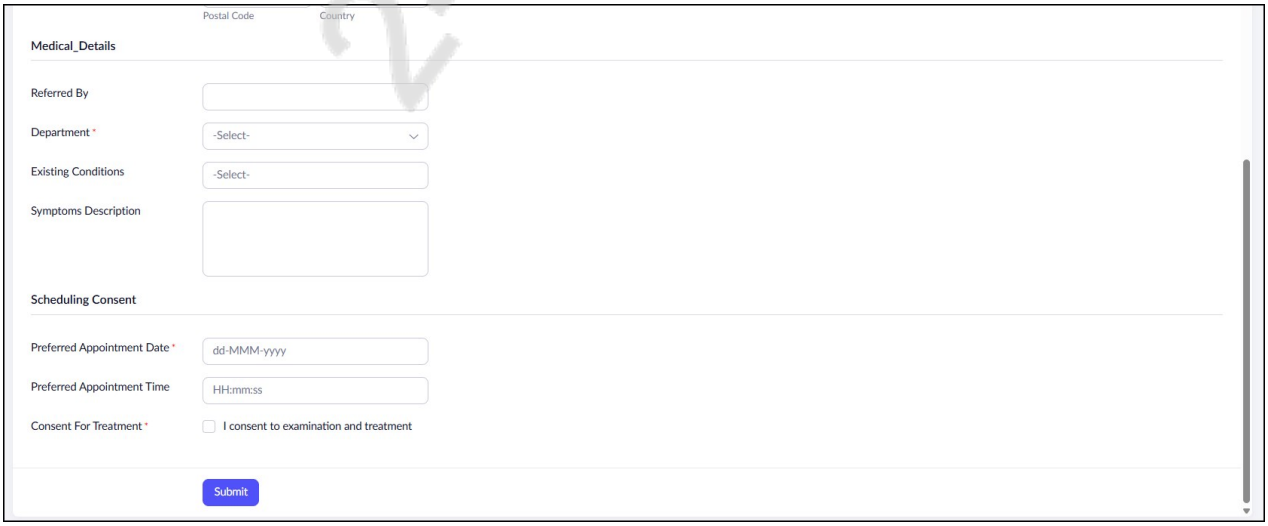

3. Output:

3.1 Appointment_Booking_Form — Patient and Contact Details

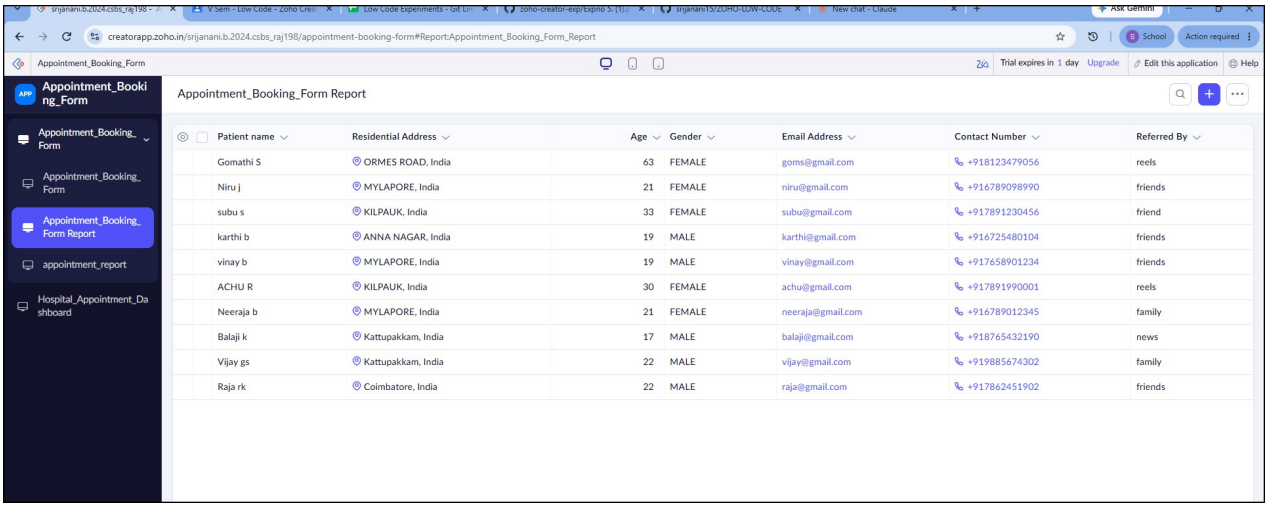

The form opens with the Patient Details section (Patient name, Age and Gender) followed by Contact Details (Email Address, Contact Number with +91 country code, and Residential Address). Mandatory fields are marked with a red asterisk.

3.2 Appointment_Booking_Form — Medical Details and Scheduling Consent

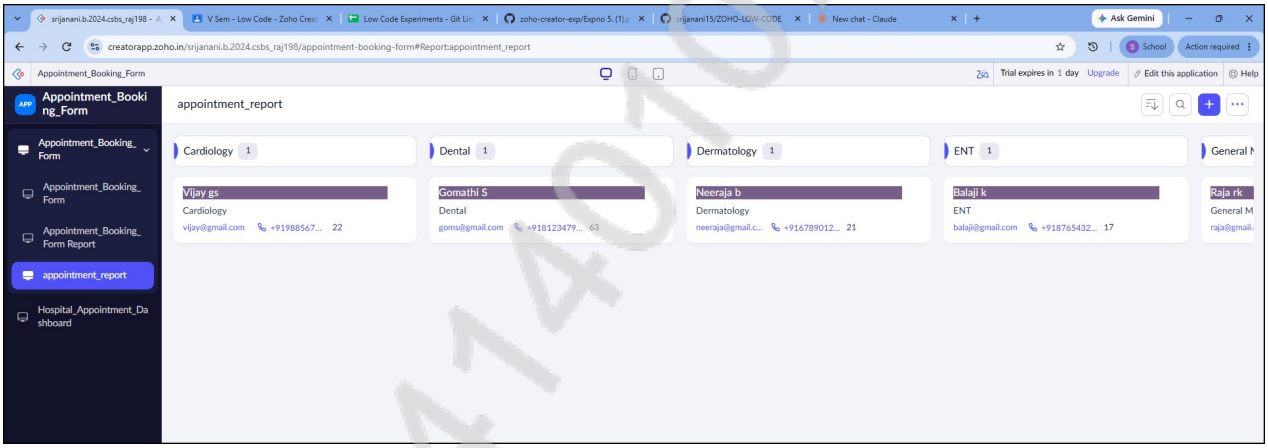

The lower part of the form captures Referred By, Department, Existing Conditions, Symptoms Description, Preferred Appointment Date and Time, and the Consent For Treatment checkbox, followed by the Submit button. The Department field drives the grouping used in the Kanban report and the dashboard chart.

3.3 Appointment_Booking_Form Report (List Report)

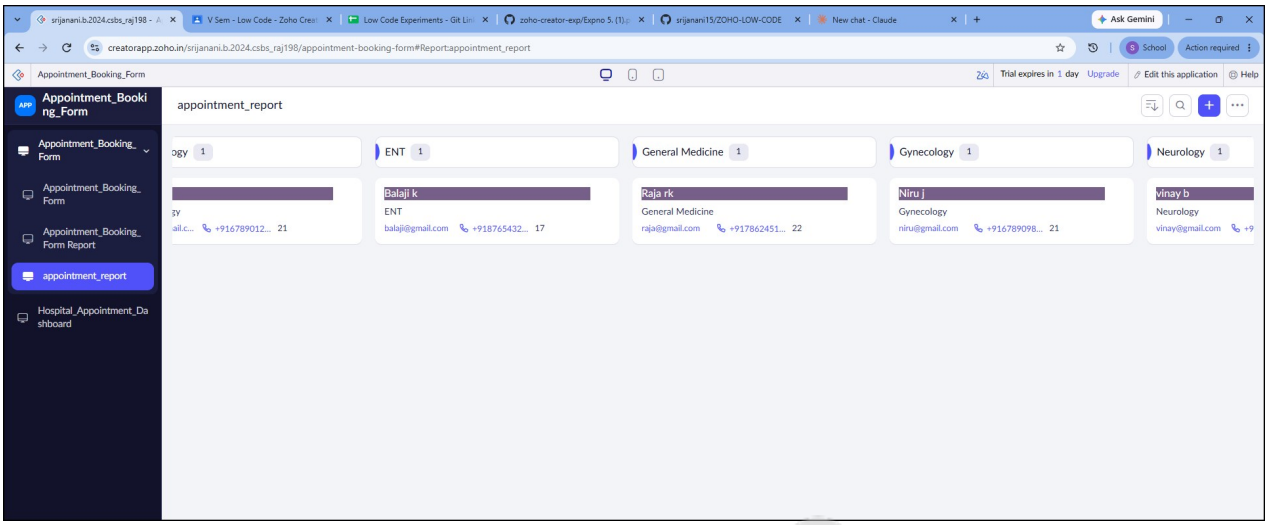

The list report displays all ten submitted bookings in a table with Patient name, Residential Address, Age, Gender, Email Address, Contact Number and Referred By, giving the front desk a complete record of every appointment request.

3.4 Kanban Report — appointment_report (Cardiology, Dental, Dermatology, ENT)

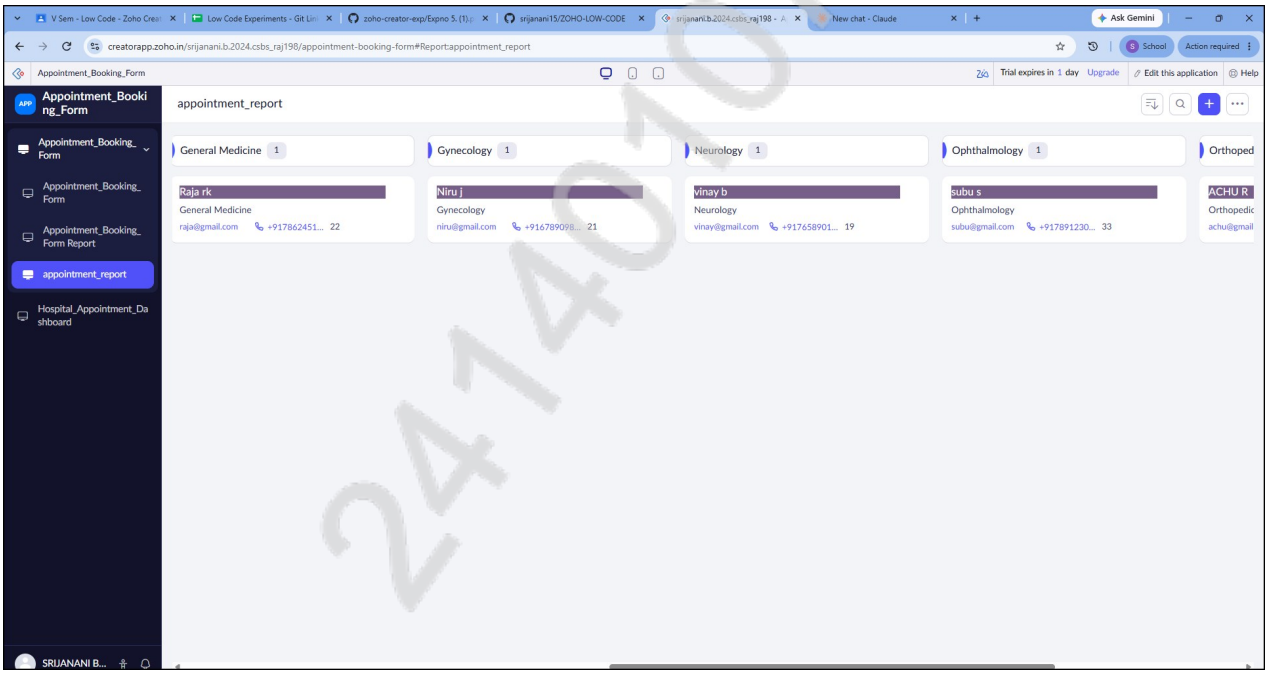

The Kanban report shows one column per department with a record count beside the heading. Each patient card lists the name, department, email, contact number and age — for example Vijay gs (Cardiology, 22), Gomathi S (Dental, 63), Neeraja b (Dermatology, 21) and Balaji k (ENT, 17).

3.5 Kanban Report — ENT, General Medicine, Gynecology, Neurology

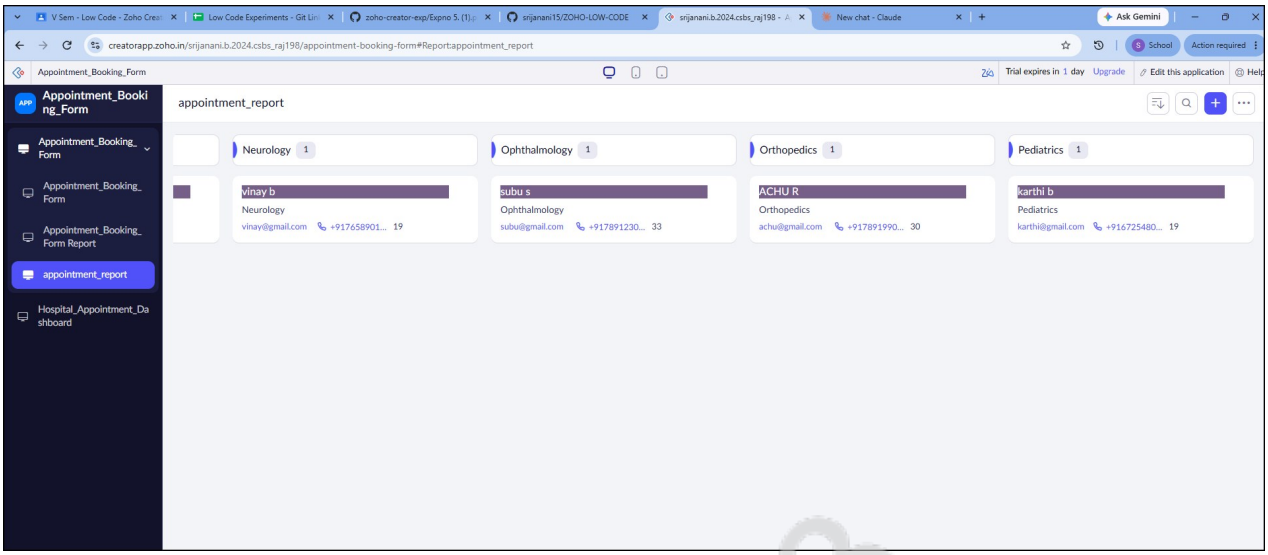

Scrolling the board horizontally shows the next set of department columns: Balaji k (ENT), Raja rk (General Medicine), Niru j (Gynecology) and vinay b (Neurology), each with a count of 1.

3.6 Kanban Report — General Medicine, Gynecology, Neurology, Ophthalmology

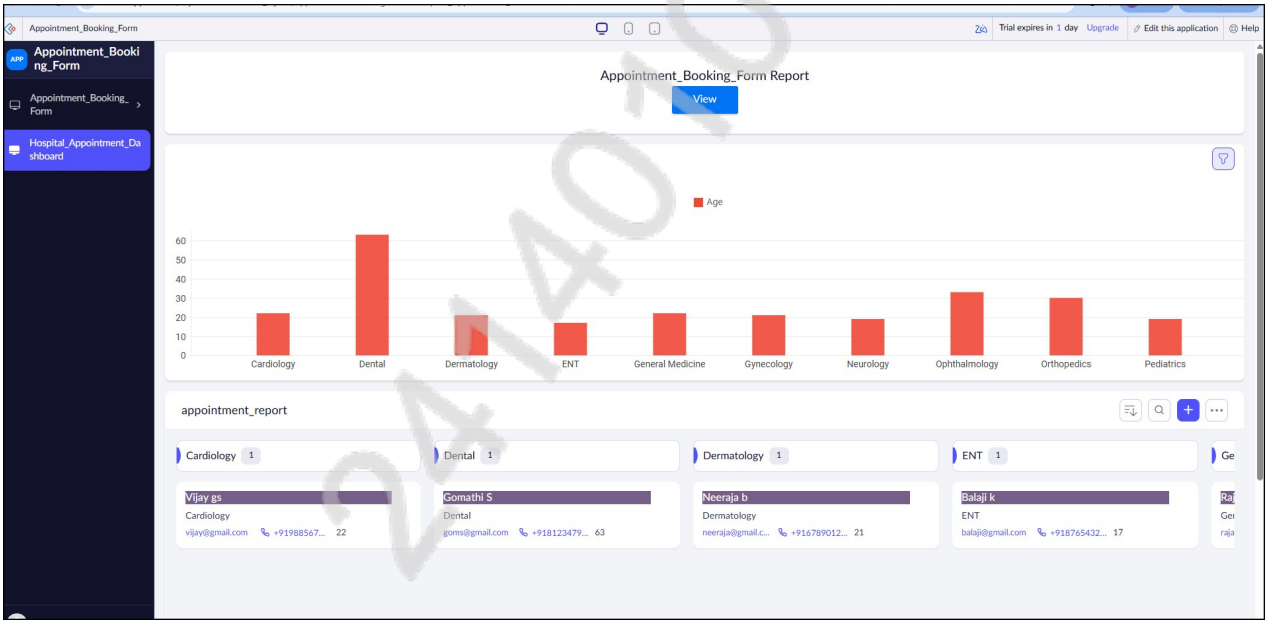

Further scrolling reveals the Ophthalmology column with the patient card subu s (age 33) and the start of the Orthopedics column with the card ACHU R.

3.7 Kanban Report — Neurology, Ophthalmology, Orthopedics, Pediatrics

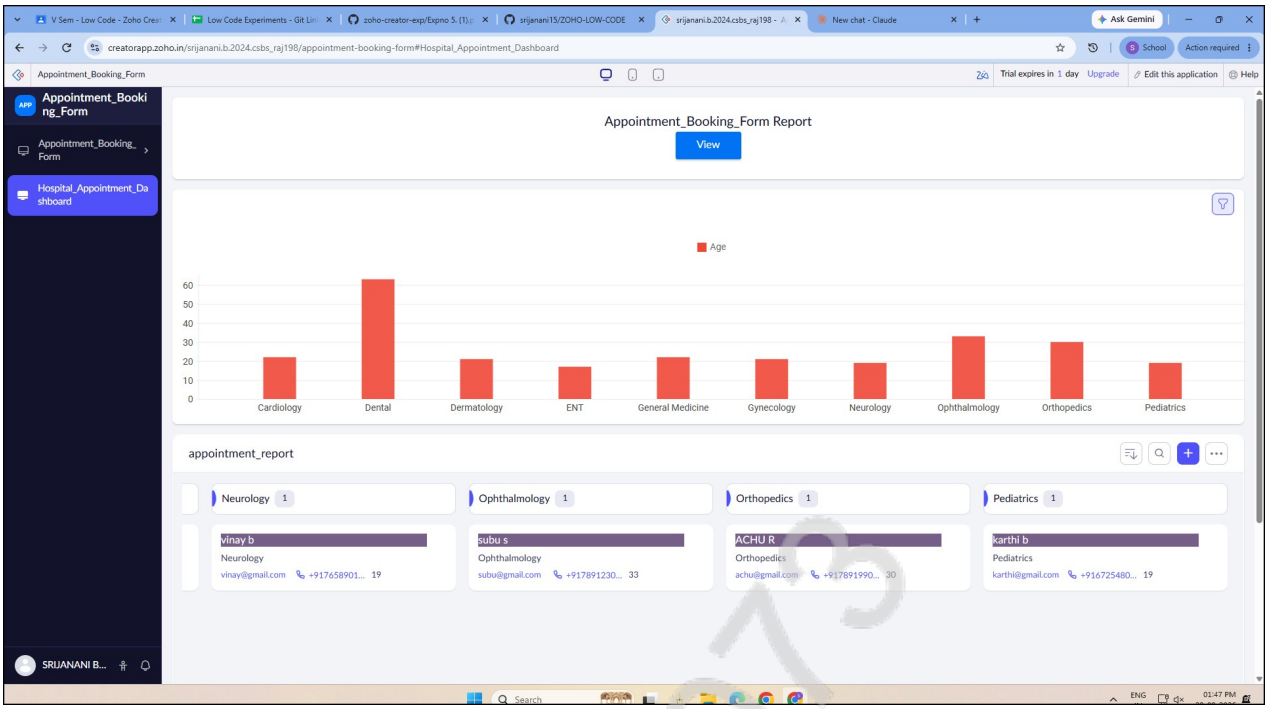

The end of the board shows the last columns: vinay b (Neurology, 19), subu s (Ophthalmology, 33), ACHU R (Orthopedics, 30) and karthi b (Pediatrics, 19), confirming that all ten departments are grouped correctly.

3.8 Hospital_Appointment_Dashboard (Page Builder output)

The custom page contains a title panel “Appointment_Booking_Form Report” with a View button, a bar chart of Age by Department, and the embedded appointment_report Kanban board below it. The navigation menu lists the form and the dashboard.

3.9 Hospital_Appointment_Dashboard — full view

The full published dashboard shows the bar chart (Dental has the highest value of 63 for the 63-year-old patient, followed by Ophthalmology at 33 and Orthopedics at 30) with the department-wise Kanban cards directly beneath it, giving staff a single-screen summary of booking activity.

4. Final Result:

A List report and a Kanban report (appointment_report) were successfully built on the Appointment_Booking_Form: the list report shows every booking in one table, while the Kanban report groups appointments by Department for quick departmental triage.

A custom dashboard page, Hospital_Appointment_Dashboard, was designed using Zoho Creator's UI Builder, combining a title panel with a View button, a Bar chart of patient age by department, and an embedded Kanban report into a single at-a-glance view.

All views were verified in live mode with ten sample records, confirming that the Kanban grouping, chart data and embedded report render correctly and pull live records from the form.

The exercise met its objective: the front desk and doctors now have complementary low-code views — listed, grouped and summarised — built entirely without custom code.
